

Output Function in Python

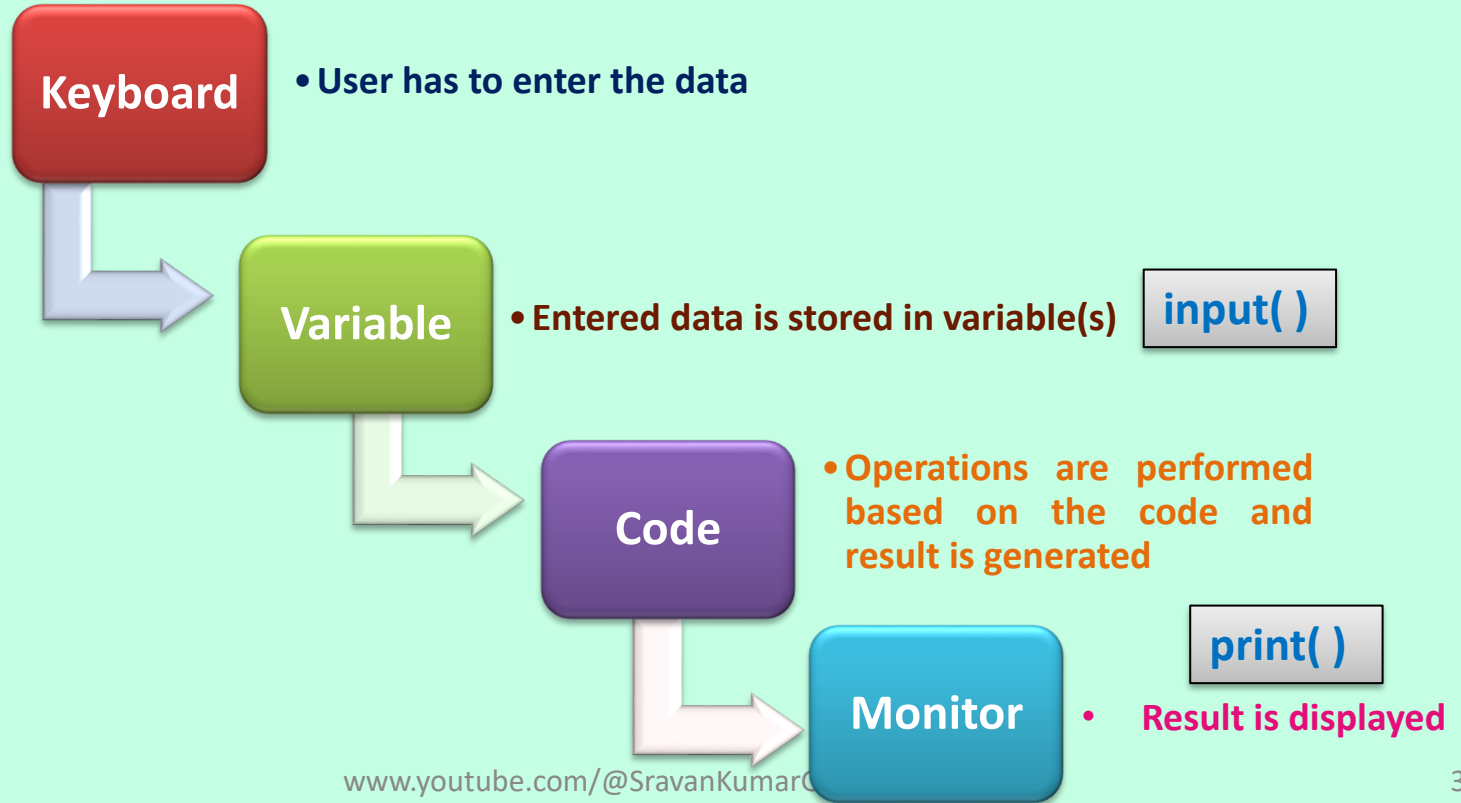

Outcomes of this Lecture

- Basic syntax of **print()** function
- About **end** attribute
- About **sep** attribute
- How to use **\n** and **\t** with print()?
- Repetition and Joining Operator
- How to print **variable value** along with a string ?

Input and Output

print()

- We use the inbuilt function print() to send the data to standard output device (screen/monitor).
- This function can be used in different formats.
- **Syntax: print(' Text to be displayed')**
- Ex: print('Hello World')
- Within the parenthesis we can use single quotes or double quotes, two are valid.

Check your knowledge

- Basic syntax of **print()** function
- About **end** attribute
- About **sep** attribute
- How to use **\n** and **\t** with print()?
- Repetition and Joining Operator
- How to print **variable value** along with a string ?

Do you know?

- Basic syntax of **print()** function
- About **end** attribute
- About **sep** attribute
- How to use **\n** and **\t** with print()?
- Repetition and Joining Operator
- How to print **variable value** along with a string ?
